Vibrational Motion Properties of Periodic Motion Pendulum Motion Motion of a Mass on a Spring The gravity force is highly predictable; it is always in the same direction (down) and always of the same magnitude -  $\text{mass} \times 9.8 \text{ N/kg}$ . The tension force is considerably less predictable. Both its direction ...

A time period (denoted by 'T' ) is the time taken for one complete cycle of vibration to pass a given point. As the frequency of a wave increases, the time period of the wave decreases. The unit for time period is 'seconds'. Frequency and time period are in a reciprocal relationship that can be expressed mathematically as:  $T = 1/f$  or as:  $f = 1/T$ . Orbital period is the time for something to go

3 Chapter 4 Amplitude of atomic vibrations By treating the atoms as simple harmonic oscillators and assuming that the average thermal energy of an atom at temperature T is  $k_B T$  → the amplitude of the atomic vibrations  $x_{\text{max}}$  For any harmonic oscillator the potential energy at distance x from the equilibrium position is  $0.5 k x^2$ , where k is the force constant.

The Restoring Force. A vibrating bobblehead often does the back and forth a number of times. The vibrations repeat themselves over and over. As such, the bobblehead will move back to (and past)

the equilibrium position every time it returns from its maximum displacement to the right or the left (or above or below).
