In number theory Fermat's Last Theorem (sometimes called Fermat's conjecture, especially in older texts) states that no three positive integers  $a$ ,  $b$ , and  $c$  satisfy the equation  $a^n + b^n = c^n$  for any integer value of  $n$  greater than 2. The cases  $n = 1$  and  $n = 2$  have been known since antiquity to have an infinite number of solutions.. The proposition was first conjectured by Pierre de Fermat in ...

In law and economics, the Coase theorem (/ ˈ k oʊ s /) describes the economic efficiency of an economic allocation or outcome in the presence of externalities. The theorem states that if trade in an externality is possible and there are sufficiently low transaction costs, bargaining will lead to a Pareto efficient outcome regardless of the initial allocation of property.

Pythagorean theorem, the well-known geometric theorem that the sum of the squares on the legs of a right triangle is equal to the square on the hypotenuse (the side opposite the right angle)—or, in familiar algebraic notation,  $a^2 + b^2 = c^2$ . Although the theorem has long been associated with Greek mathematician-philosopher Pythagoras (c. 570–500/490 bce), it is actually far older.

The binomial theorem was known for the case by Euclid around 300 BC, and stated in its modern form by Pascal in a posthumous pamphlet published in 1665. Pascal's pamphlet, together with his correspondence on the subject with Fermat beginning in 1654 (and published in 1679) is the basis for naming the arithmetical triangle in his honor.

...what is now known as Fermat's last theorem—namely, that there are no rational solutions to  $x^3 + y^3 = z^3$ . The great scientist Ibn al-Haytham (965–1040) solved problems involving congruences by what is now called Wilson's theorem, which states that, if  $p$  is a prime, then  $p$  divides  $(p ...$
