Transport Phenomena A Unified Approach

Since the 19th century, some physicists, notably Albert Einstein, have attempted to develop a single theoretical framework that can account for all the fundamental forces of nature – a unified field theory. Development. Although “interdisciplinary” and “interdisciplinarity” are frequently viewed as twentieth century terms, the concept has historical antecedents, most notably Greek philosophy. In this review, we introduce immersed boundary (IB) methods for fluid-structure interactions (FSIs) of rigid and elastic bodies. IB methods impose momentum forcing on an Eulerian mesh to satisfy boundary conditions on the interface between fluid and structure, which enables us to use a non-body conforming grid system for complex-shaped moving bodies.

The so called “Russian dolls” approach for the implementation framework design was followed. In this approach, an abstract top-level framework provides the basic interface to other Geant 4 categories. It satisfies the most general use-case for hadronic shower simulation, namely to provide inclusive cross-sections and final state generation.
