The eight unknown solutions came from the original 12 solutions that were already tested. I then wrote the numbers of the eight solutions horizontally on a new data table. I then reversed the order of the numbers as I wrote them down the vertical column to mimic the set up of the chemical reactions in part 1.

When I've done trainings on the 8-solution problem, participants (as individuals) have had mixed reactions [pun intended]. They enjoy the microscale nature of the lab, the easy clean-up, the ability to see so many visually stimulating double replacement reactions, and yet the sheer volume of work is daunting.

Eight queens puzzle. Thus, a solution requires that no two queens share the same row, column, or diagonal. The eight queens puzzle is an example of the more general n queens problem of placing n non-attacking queens on an $n \times n$ chessboard, for which solutions exist for all natural numbers n with the exception of $n = 2$ and $n = 3$.
