In physics, elasticity (from Greek ἐλαστός "ductile") is the ability of a body to resist a distorting influence and to return to its original size and shape when that influence or force is removed. Solid objects will deform when adequate forces are applied to them. If the material is elastic, the object will return to its initial shape and size when these forces are removed. hooks law ...

Dynamic mechanical analysis (abbreviated DMA, also known as dynamic mechanical spectroscopy) is a technique used to study and characterize materials. It is most useful for studying the viscoelastic behavior of polymers. A sinusoidal stress is applied and the strain in the material is measured, allowing one to determine the complex modulus. The temperature of the sample or the frequency of the ...

2 The "Joukowsky equation" for fluids The fundamental equation in waterhammer theory relates pressure changes, Δp , to velocity changes, Δv , according to $\Delta = \Delta p c v p$ (1) where p is the fluid mass density and c is the speed of sound. Korteweg's (1878) formula defines
