Influenza Strikes Again: 100 Years After Great Pandemic

The 1918 influenza pandemic (January 1918 – December 1920; colloquially known as Spanish flu) was an unusually deadly influenza pandemic, the first of the two pandemics involving H1N1 influenza virus. It infected 500 million people around the world, including people on remote Pacific islands and in the Arctic, and resulted in the deaths of 50 to 100 million (three to five percent of the ...

Spanish flu - Wikipedia

Influenza, commonly known as the flu, is an infectious disease caused by an influenza virus. Symptoms can be mild to severe. The most common symptoms include: high fever, runny nose, sore throat, muscle pains, headache, coughing, sneezing, and feeling tired. These symptoms typically begin two days after exposure to the virus and most last less than a week.

In "Influenza virus attachment to cells" we left the intact virion on the cell surface. The next step is that the viral genetic information – for influenza virus, the individual RNA segments – must enter the cell so that it can be reproduced. The mechanism for influenza virus, illustrated below, involves a step that is

Release of influenza viral RNAs into cells - virology

The pneumonic influenza crisis of 1918–19 was a medical catastrophe on a scale unequalled since the 'black death' of the middle ages. It is estimated to have infected approximately a quarter of the world's population, killing between fifty and 100 million people.

An Intimate Pandemic: The Community Impact of Influenza in ...

Influenza A viruses tend to garner most of the attention, but let's not forget that there are two other virus types, B and C. The enveloped influenza A virions have three membrane proteins (HA, NA, M2), a matrix protein (M1) just below the lipid bilayer, a ribonucleoprotein core (consisting of 8 viral RNA segments and
