Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in organisms.. Gregor Mendel, a scientist and Augustinian friar, discovered genetics in the late 19th-century.Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring. He observed that organisms (pea plants) inherit traits by way of discrete "units ...

LAB 9 - Principles of Genetic Inheritance Overview In this laboratory you will learn about the basic principles of genetic inheritance, or what is commonly referred to as "genetics".

### **LAB 9 Principles of Genetic Inheritance**

Nonprobability sampling is any sampling method where some elements of the population have no chance of selection (these are sometimes referred to as 'out of coverage'/'undercovered'), or where the probability of selection can't be accurately determined. It involves the selection of elements based on assumptions regarding the population of interest, which forms the criteria for selection.

In order to understand the effect of non-random mating patterns, it is useful to first examine the results of random mating. As Hardy and Weinberg demonstrated in the early 20th century, the gene pool of a population that is mating randomly and is not subject to any other evolutionary process will not change--it will remain in equilibrium.

### **Modern Theories of Evolution: Non-random Mating**
