Magnetic north has never sat still. In the last hundred years or so, the direction in which our compasses steadfastly point has lumbered ever northward, driven by Earth's churning liquid outer ...

The north magnetic pole just changed. Here's what that means.

02/05/2019. National Centers for Environmental Information scientists have updated the world magnetic model (WMM) mid-cycle, as Earth's northern magnetic pole has begun shifting quickly away from the Canadian Arctic and toward Siberia, an NCEI report said this week. The new WMM more accurately represents the change of the magnetic field since 2015.

Magnetic Field. Magnetic fields are produced by electric currents, which can be macroscopic currents in wires, or microscopic currents associated with electrons in atomic orbits. The magnetic field B is defined in terms of force on moving charge in the Lorentz force law. The interaction of magnetic field with charge leads to many practical applications.

The magnetic compass is the most familiar compass type. It functions as a pointer to "magnetic north", the local magnetic meridian, because the magnetized needle at its heart aligns itself with the horizontal component of the Earth's magnetic field. The magnetic field exerts a torque on the needle, pulling the North end or pole of the needle approximately toward the Earth's North magnetic pole ...

The magnetic field strengths are the total magnetic field strengths in nanoteslas. The angle shown in parenthesis is angle of the magnetic field downward direction. The influence of the downward tilt on the fast E1 pulse is quite complicated, but when there is less downward tilt, the intensity of the EMP tends to be more symmetrical around the detonation point.

The magnetic moment is the magnetic strength and orientation of a magnet or other object that produces a magnetic field. Examples of objects that have magnetic moments include: loops of electric current (such as electromagnets), permanent magnets, elementary particles (such as electrons), various molecules, and many astronomical objects (such as many planets, some moons, stars, etc).

Earth the Magnet. Why do magnets point north or south? A great English scientist named William Gilbert answered that question in 1600 when he suggested that Earth is a giant magnet. Photo: We can use magnetic compasses like this to navigate because Earth is itself a giant magnet. Photo by Staff Sgt. Jacob N. Bailey courtesy of US Air Force. Gilbert's theory was published in *De Magnete* (Of

Magnetism for kids - A simple introduction

The magnetic moment of a magnet is a quantity that determines the force that the magnet can exert on electric currents and the torque that a magnetic field will exert on it. A loop of electric current, a bar magnet, an electron, a molecule, and a planet all have magnetic moments.. Both the magnetic moment and magnetic field may be considered to be vectors having a magnitude and direction.

The second key change, Michel said, is the addition of a Product Development Manager. This individual's responsibility will be to create new ideas for products and services, create pilot programs to quickly test those ideas, and then -- if the pilot programs are successful -- transition them to operations.
