The Extended Phenotype is a 1982 book by Richard Dawkins, in which the author introduced a biological concept of the same name. The main idea is that phenotype should not be limited to biological processes such as protein biosynthesis or tissue growth, but extended to include all effects that a gene has on its environment, inside or outside the body of the individual organism.

In 2 brothers and a third unrelated patient, Lohr et al. (1965) found marked reduction of red cell, leukocyte, and platelet hexokinase activity. This is apparently a different defect from the hexokinase deficiency that is limited to red cells and results in hemolytic anemia alone. A consistent defect in hexokinase cannot be considered as proved (Brunetti et al., 1966).

1. Introduction. Glaucoma, a group of ocular disorders characterized by progressive optic neuropathy, is a major leading cause of irreversible blindness worldwide. A global projection estimated that the number of patients with glaucoma may reach 111.8 million in 2040. Previous studies have shown that intraocular pressure (IOP) is a major risk factor in glaucoma progression and control of IOP ...

C57BL/6J is the most widely used inbred strain and the first to have its genome sequenced. Although this strain is refractory to many tumors, it is a permissive background for maximal expression of most mutations. C57BL/6J mice are resistant to audiogenic seizures, have a relatively low bone density, and develop age related hearing loss. They are also susceptible to diet-induced obesity, type ...

A chromosome is a deoxyribonucleic acid molecule with part or all of the genetic material of an organism. Most eukaryotic chromosomes include packaging proteins which, aided by chaperone proteins, bind to and condense the DNA molecule to prevent it from becoming an unmanageable tangle.. Chromosomes are normally visible under a light microscope only when the cell is undergoing the metaphase of ...

GenAge: The Ageing Gene Database. GenAge has two main resources: a database of ageing- and longevity-associated genes identified in model organisms and a database of human ageing

genes. Both databases are manually curated. The model organisms database has more genes, yet the human database is more detailed and contains substantially more data and information for each gene.
