Thermodynamics An Engineering Approach Seventh

In thermodynamics, work performed by a system is energy transferred by the system to its surroundings, due solely to macroscopic forces exerted by the system on its surroundings, where those forces, and their external effects, can be measured. Such work is the only kind by which a thermodynamic system can be made to lift a weight. The externally measured forces and external effects may be ...

Work (thermodynamics) - Wikipedia

In thermodynamics, an isentropic process is an idealized thermodynamic process that is both adiabatic and reversible. The work transfers of the system are frictionless, and there is no transfer of heat or matter. Such an idealized process is useful in engineering as a model of and basis of comparison for real processes. The word "isentropic" is occasionally, though not customarily, interpreted ...

Turbulent Flow. In fluid dynamics, turbulent flow is characterized by the irregular movement of particles (one can say chaotic) of the fluid. In contrast to laminar flow the fluid does not flow in parallel layers, the lateral mixing is very high, and there is a disruption between the layers. Turbulence is also characterized by recirculation, eddies, and apparent randomness.

The low-pressure heavy-water moderator, contained in a vessel called the calandria, provides efficient fuel utilization and permits the use of natural rather than enriched uranium. The moderator is separate from the high-pressure coolant. A CANDU fuel channel contains 12 or 13 fuel bundles end-to-end.
