ARP Message Format. Address resolution using ARP is accomplished through the exchange of messages between the source device seeking to perform the resolution, and the destination device that responds to it. As with other protocols, a special message format is used containing the information required for each step of the resolution process.. ARP messages use a relatively simple format.

In modern protocol design, protocols are layered to form a protocol stack. Layering is a design principle which divides the protocol design task into smaller steps, each of which accomplishes a specific part, interacting with the other parts of the protocol only in a small number of well-defined ways.

Figure 4-2 TCP Reset Sensor Response.. With the IP blocking option, the sensor updates the access control list (ACL) on the perimeter router to deny all traffic from the offending IP address (see Figure 4-3). This response prevents the attacker from sending any further traffic into the protected network from that specific host.
